IF3E Carpooling website project report

Introduction :

This project was supposed to be the final goal of the IF3E UE. In this document, I am going to present you all the information needed in order to understand the project.

The entity-relationship diagram

Here is the entity-relationship diagram used to represent the different relations between the tables in the project.

Relational model

Explanation of 3NF normalization

Implemented features

This project includes the basic required features asked in order to respect the instructions.

We can basically use the website for creating new accounts by using the registering option and log in to them.

We can also use our accounts to add the cars we posess and create trips in order to publish them to the other users of the website.

Moreover, there are also a few optional features that were not required in the project but are still present in the website such as an international telephone format helper tool in the registering page

Conclusion

The basic idea of the UE IF3E was to teach how to use relational databases and how to interact with them. Even though there are a lot of possible use in a programmer life, the exercises still stayed a bit abstract and were not totally enjoyable since the purpose of the TD's exercise was only to help us practicing what we learnt in course.

On the other hand, this project tought us relational databases, SQL and PHP in a completly other way ; I had to work in a specific environment with a specific context and creating a full website.

To be honest, I found this project very difficult, not only because I never saw how to use PHP and how to connect it with SQL before, but because of the small amount of time given too. I only had two weeks to do the project, which was quite stressful I must admit but also very rewarding too.

There is a concept called the Parkinson's law which state that the work we do fill always the amount of time we're given to do it… because I had to do this project in a very small amount of time, I had the feeling that I put great efforts on this project, even if I had to ask help on the internet as every good programmer (stack overflow, AI, w3schools…) all that stuff helped me and I can proudly announce that I created a website in two weeks.

On top of that,
